slide 4 gaius

Inside Chisel

- design goals
 - in the style of Unix
 - command line only
 - one command to achieve one task well
- chisel is a package with at least three command line programs
 - txt2pen convert a txt file into a pen file
 - pen2map convert a pen file into a map file (doom3)
 - nndpen generate a random pen file
- for your coursework you should consider extending:
 - pen2map or txt2pen or introducing a third which could manipulate a pen or txt file

slide 3 gaius

rndpen

rndpen

- generate a random pen map
- highly alpha code, but it will generate a corridor based random pen file
- the program does always find a map
- so some experimentation is required for the pseudo random numbers to mesh with the algorithm to generate a map

```
$ rndmap -h
Usage rndpen [-a minroomsize] [-b maxroomsize] \
  [-c mincorridorlength] [-d maxcorridorlength]
  [-e totalcorridorlength] [-h] [-o outputfile] \
  [-s seed] [-x maxx] [-y maxy]
                             (default is 6)
  -a minroomsize
  -b maxroomsize
                             (default is 13)
  -c mincorridorsize
                             (default is 15)
  -d maxcorridorsize
                             (default is 70)
  -e totalcorridorlength
                             (default is 300)
  -o outputfile
                             (default is stdout)
                             (default is 3)
  -s seed
  -x minx for whole map
                             (default is 120)
  -y maxy for whole map
                             (default is 80)
```

rndpen

rndpen

- \$ rndmap -s 3 -a 5 -b 10 -c 5 -d 10 -e 20 -x 30 -y 30 | p
- notice how the command line tools can be combined using the pipe

rndpen

- rndpen prioritises placing random corridors on the map
- it then tries to fill in the remaining gaps with boxes and will combine boxes to give rooms of desired min/max dimensions
- it also restricts the number of walls to 8
- it might be useful if you wanted to generate a map quickly

Inside: txt2pen

- source is in one file: \$HOME/Sandpit/chisel/python/txt2pen.py
 - 690 lines of Python
- uses the following command line options
- \$ cd \$HOME/Sandpit/chisel/python \$ python txt2pen.py -h
 - -d debugging
 - -h help
 - -V verbose
 - -v version
 - -o outputfile name

Inside: txt2pen

- notice the -o option which takes an additional argument (filename)
- it uses the getopt module to handle the options
 - see function handleOptions

Inside: txt2pen

Inside: txt2pen

slide 12

it uses a dictionary to maintain the defines

slide 11 gaius

- stores the map in a 2D list (array)
 - mapGrid

Inside: txt2pen

it determines the walls of a room

return (None, outputName)

- it finds the room number (location)
- moves to the top left inside the room (generateRoom)
- it then attempts to turn left as it moves around the room (the wall is always on the left)
- examine scanRoom for the implementation
- it looks the square forward and square forward left comparing the two characters: ## or -- or

wall and – for space

a space should be thought of as not a wall

slide 15

Inside: txt2pen

- scanRoom will start at the top right corner of a room and walk around the edge with the wall always on the left
 - it builds a list of walls, a wall stops/starts at each turn
- if it sees ## then it must turn right
 - the old wall is stored and a new start position is remembered
- if it sees -- then it must turn left
 - the old wall is stored and a new start position is remembered
- if it sees #- then it continues moving a square forward

Extending chisel (txt2pen)

- one of the obvious improvements is for chisel to automatically introduce lights
 - add another option to enable automatic lighting
 - -1
- copy scanRoom into a new function introduceLights
- adapt this new function to add lights
 - but only if the rooms has no user defined lights

slide 16

Inside: pen2map

chisel/python/pen2map.py is 2086 lines of Python

```
$ cd $HOME/Sandpit/chisel/python
$ python pen2map.py -h
Usage: pen2map [-c filename.ss] [-dhmtvV] [-o outputfile]
  -c filename.ss
                     use filename.ss as the defaults for the
                     debugging
  -d
                     provide comments in the map file
  -е
  -g type
                     game type. The type must be 'single'
  -h
                     help
  -m
                     create a doom3 map file from the pen
  -s
                     generate statistics about the map fil-
  -t
                     create a txt file from the pen file
  -V
                     generate verbose information
                     print the version
  -o outputfile
                     place output into outputfile
```

Example style sheet for the map

- how are textures defined could use the defaults and ignore this slide!
 - or examine chisel/python/tiny.ss

```
# style sheet for simple doom3 maps

define floor textures/hell/qfloor
define portal textures/editor/visportal
define open textures/editor/visportal
define closed textures/hell/wood1
define secret textures/hell/bricksla_d
define wall textures/hell/cbrick2b
define ceiling textures/hell/wood1
```

pen2map

ebnf

- reads in a pen file and converts it into a doom3 map file
- the pen map is parsed by a top down recursive descent parser
 - the pen syntax is described by an ebnf grammar
 - (extended backus naur form)
 - hand translated into a top down recursive descent parser
- recursive descent parsers are fast and straightforward to implement once the grammar is defined
 - they also allow for strict syntax checking of input
 - they are used extensively in the construction of compilers

- consists of terminal symbols and non-terminal production rules which define the legal sequence of symbols
- in C++ for example, a terminal symbol might be while, for, do, = ; 0 etc
- a rule might be:

```
assignment := lhs "=" rhs =:
```

meaning the assignment rule is satisfied if there is a legal lhs followed by = followed by rhs

slide 19 gaius

pen example

```
ROOM 1
WALL
1 21 18 21
18 21 18 14
18 14 1 14
1 14 1 21
DOOR 18 18 18 17 STATUS OPEN LEADS TO 2
MONSTER python_doommarine_mp AT 13 18
LIGHT AT 12 20
LIGHT AT 4 15
LIGHT AT 15 15
SPAWN PLAYER AT 3 18
END
```

slide 20

pen grammar in ebnf

```
FileUnit := RoomDesc { RoomDesc } [ RandomTreasure ] "END
RoomDesc := 'ROOM' Integer
{ WallDesc | DoorDesc | TreasureDesc } 'END'
WallDesc := 'WALL' WallCoords { WallCoords } =:
WallCoords := Integer Integer Integer Integer =:
DoorDesc := 'DOOR' DoorCoords { DoorCoords } =:
```

pen grammar in ebnf

slide 23 gaius

Translating ebnf grammar into a top down parser

- once the grammar is defined it is straightforward to implement a top down parser
- if the grammar is said to be well formed if we only need to look at the next token to determine the flow of control in the parser

ebnf meta symbols

- { foo }
 - means it is legal to have 0 or more occurrences of foo
- [foo]
 - means it is legal to have 0 or 1 occurrence of
- (foo|bar)
 - here the (and) group together the extent of the
- "foo" represents the terminal symbol foo
- as opposed to the rule foo

slide 24

Translating ebnf grammar into a top down parser

- we define a few helper functions
 - expect ("foo") insists that the next token is "foo" and generates an error if it is not "foo"
 - if "foo" is seen the consume this symbol and move onto the next
- expecting (list)
 - returns True if any symbol in list matches the current symbol
- integer return True if the current symbol is an integer
 - if True store the value of the integer in curinteger
