

File export/File import/Next/Back

- improving the export function and coordinating the result of an unsuccessful export with the doom button
 - if the export should fail, then the doom3 button should be frozen

- ```
def save_map (name):
 f = open (name, "w")
 f = write_assets (f)
 f.write ("\n") # add blank line for eye candy
 f = write_map (f)
 f.close ()

def myexport (name, tap):
 pygame.display.update ()
 save_map (current_map_name)
 check_export ()
```

slide 3  
gaius

## check\_export

- ```
def check_export ():
    etc
```

slide 4
gaius

write_map

- there is currently a problem with write_map and chisel
 - if the map has leading spaces chisel will fail
 - if the map has trailing spaces then chisel will also fail
- while this is a bug in chisel
 - we can avoid it by trimming spaces from our file in write_map
 - this is common practice - in software engineering

write_map

```

def write_map (f):
    left, right = determine_range ()
    m = ""
    mdict = {"v":"#", "h":"#", "-":".", "|":".", " ":" ",
            "H":"H", "S":"S", "T":"T"}
    x, y = cell_array.high ()
    for j in range (y):
        for i in range (left, right+1):
            if mdict.has_key (cell_array.get (i, j)):
                m += mdict[cell_array.get (i, j)]
            else:
                m += cell_array.get (i, j)
        # skip blank lines
        m = m.rstrip ()
        if len (m) > 0:
            m += "\n"
    f.write (m)
    return f

```

determine_range

```

def determine_range ():
    left = -1
    x, y = cell_array.high ()
    right = x
    for j in range (y):
        for i in range (x):
            if cell_array.get (i, j) != " ":
                if (left == -1) or (i < left):
                    left = i
                if i > right:
                    right = i
    return left, right

```

determine_range**determine_range**

\$HOME/Sandpit/touchgui/touchgui.py

```

#
# create_cache - Pre-condition: None.
#               Post-condition: directory $HOME/.cache/touchgui
#
def _create_cache ():
    d = os.path.join (os.path.join (os.environ["HOME"], ".cache"),
                      os.system ("mkdir -p %s" % (d))

```

\$HOME/Sandpit/touchgui/touchgui.py

```

#
# reset_cache - Pre-condition: None.
#              Post-condition: all contents of $HOME/.cache/tou
#
def reset_cache ():
    d = os.path.join (os.path.join (os.environ["HOME"], ".cache"),
                      _safe_system ("rm -r %s" % (d))
                      _create_cache ()
reset_cache ()

```

- you should enable `reset_cache ()` which will delete the cache and create an empty cache directory

Adding double tap to construct walls

```

elif last_pos[1] == y:
    for i in range (min (x, last_pos[0]), max (x, last_pos[0]), 1):
        old = cell_array.get (i, y)
        button = button_array.get (i, y)
        if old == " ":
            button.to_wall ()
            cell_array.set_contents (i, y, "v")

```

- it would be good if the export facility checked to see that the map exported was successfully converted by chisel
 - chisel like all GNU/Linux and Unix programs exits with status 0 on success
 - and non zero on failure
 - we can test this and change the doom3 button (freeze it)
- we need to change: `myexport` and add `try_export` which can also be called from the `mydoom3` callback

Implementing a safe export

Implementing a safe export

```

def myexport (name, tap):
    pygame.display.update ()
    save_map (current_map_name)
    try_export (os.getcwd (), current_map_name)

def try_export (directory, map_name):
    os.chdir (os.path.join (os.getenv ("HOME"), "Sandpit/"))
    r = os.system ("./developer-txt2map " + os.path.join (os.getcwd (), "test.txt") + " " + os.path.join (directory, "test.txt"))
    if r == 0:
        print "all ok"
        doom_button.set_images (private_list ("doom3"))
    else:
        doom_button.set_images (error_list ("doom3"))

```

Implementing a safe export

```

def mydoom3 (param, tap):
    pygame.display.update ()
    pygame.time.delay (toggle_delay * 2)
    try_export (os.getcwd (), "test.txt")
    pygame.quit ()
    dmap ()
    exec_doom_map ()
    quit ()

```

Conclusion and tutorial

- integrate some of these changes into your touchmap
- consider how you might also
 - read a map file into touchmap

Extra graphic assets for touchmap

- the tick and hellknight are available [touchmap-extra-assets](http://flopsie.comp.glam.ac.uk/download/targz/touchmap-extra-assets.gz) (<http://flopsie.comp.glam.ac.uk/download/targz/touchmap-extra-assets.gz>)
- you can download and extract them by:

```
$ cd $HOME/Sandpit/touchmap/images
$ wget http://flopsie.comp.glam.ac.uk/download/targz/touchmap-extra-assets.gz
$ tar xzf touchmap-extra-assets.gz
```

Script to automatically build and run touchmap

- here is a script you can run from the command line to automatically rebuild and run your touchmap (<http://flopsie.comp.glam.ac.uk/download/targz/run>)
- you can install it via:

```
$ wget http://flopsie.comp.glam.ac.uk/download/targz/run
$ chmod 755 run
```
- you can run it via:

```
$ ./run
```
